

Name: Sanjib Sapui

Roll: 21f1002072

Project: Ticket Show

First, I imported flask and flask_sqlalchemy libraries. From flask library, I have used render_template, redirect, url_for and session methods. Then I created 4 tables: venue, show, booking and username. In venue table, columns are venue_id, venue_name, location, capacity. In show table, columns are show_id, show_name, rating, timing, tags, price. Booking table is to store each booking data. Username table is for storing unique users. For admin, unique login system is implemented. I have add CRUD operation for venue and show for admin. In admin dashboard, I showcased all venues and for each venue, all shows. For users, I have created login for existing user and register for new user. In user dashboard, I showcased all venues and for each venue, all shows with book attribute. Bookings tag is for showing all bookings of a user.

Self-declaration:

Admin and user login: done

CRUD for Venue: done

CRUD for Show: done

Search for venue/show: done

Book show ticket: done

Admin-login:

Username: Sanjib

Password: 12345
